

# OPTIGA™ TPM Application Note

## Remote Attestation

26 Nov, 2020

Revision 1.0

## About this document

### Scope and purpose

This document explains how an OPTIGA™ TPM SLx 9670 TPM2.0 can be used on a Raspberry Pi® to perform TPM-based remote attestation.

Remote attestation is a mechanism to enable a remote system (server) to determine the integrity of a platform of another system (Raspberry Pi®). In a Linux-based system, a security feature known as the Integrity Measurement Architecture (IMA) can be used to capture platform measurements. Together with TPM a hardware-based security and its set of attestation features, it can be used to perform authentication and to protect the IMA measurement.

The OPTIGA™ TPM SLx 9670 TPM2.0 uses a SPI interface to communicate with the Raspberry Pi®. The OPTIGA™ TPM SLx 9670 TPM2.0 product family with SPI interface consists of 3 different products:

- OPTIGA™ TPM SLB 9670 TPM2.0 standard security applications
- OPTIGA™ TPM SLI 9670 TPM2.0 automotive security applications
- OPTIGA™ TPM SLM 9670 TPM2.0 industrial security application

OPTIGA™ TPM SLx 9670 TPM2.0 products are fully TCG compliant TPM products with CC (EAL4+) and FIPS certification. The OPTIGA™ TPM SLx 9670 TPM2.0 products standard, automotive, and industrial differ with regards to supported temperature range, lifetime, quality grades, test environment, qualification, and reliability to fit the target applications requirements. An overview of all Infineon OPTIGA™ TPM products can be found on Infineon's website [2][3]. More information on TPM specification can be found on Trusted Computing Group (TCG) in reference [4].

### Intended audience

This document is intended for customers who want to increase the security level of their embedded platforms using a TPM 2.0 and like to evaluate the implementation of TPM-based remote attestation for their target applications.

# 1 Prepare Raspberry Pi®

This section describes all necessary steps needed to build a Raspberry Pi® bootable SD card image.

## 1.1 Prerequisites

- Raspberry Pi®
  - (Recommended) Raspberry Pi® 4 with 4GB RAM or above
  - Raspberry Pi® 3 Model B V1.2
- Micro SD card (≥8GB) flashed with Raspberry Pi® OS. Download the official image (raspbian-2020-02-14) from [1]
- SD card reader
- Host machine running Ubuntu 18.04 LTS
- OPTIGA™ TPM (TPM2.0)
  - SLB 9670
  - SLI 9670
  - SLM 9670

Figure 1: Infineon Iridium SLx 9670 TPM2.0 SPI Board [2] on Raspberry Pi® 4

## 1.2 Kernel Build Guide

This guide is for cross-compilation only. Optionally, native-compilation guide can be found at [5].

Install required dependencies on host machine:

```
$ sudo apt install git bc bison flex libssl-dev make libc6-dev libncurses5-dev  
libncurses5-dev
```

Install toolchain and set environment variable:

```
$ git clone https://github.com/raspberrypi/tools ~/tools  
$ export PATH=$PATH:~/tools/arm-bcm2708/arm-linux-gnueabi/bin
```

Download Linux kernel source (Approx. 3.5GB):

```
$ git clone -b rpi-4.19.y https://github.com/raspberrypi/linux  
$ cd linux
```

At the time of testing:

```
$ git checkout 06606627043f72d22881563d485268fec2acd56d
```

Build for Raspberry Pi® 3:

```
# Prepare  
$ KERNEL=kernel7  
$ make ARCH=arm CROSS_COMPILE=arm-linux-gnueabi- bcm2709_defconfig  
  
# Configure (optional)  
$ make ARCH=arm CROSS_COMPILE=arm-linux-gnueabi- menuconfig  
  
# Build  
$ make -j$(nproc) ARCH=arm CROSS_COMPILE=arm-linux-gnueabi- zImage modules dtbs
```

Build for Raspberry Pi® 4:

```
# Prepare  
$ KERNEL=kernel7l  
$ make ARCH=arm CROSS_COMPILE=arm-linux-gnueabi- bcm2711_defconfig  
  
# Configure (optional)  
$ make ARCH=arm CROSS_COMPILE=arm-linux-gnueabi- menuconfig  
  
# Build  
$ make -j$(nproc) ARCH=arm CROSS_COMPILE=arm-linux-gnueabi- zImage modules dtbs
```

Transfer kernel modules, kernel image, and device tree blobs to a SD card (remember to set `/dev/sdbX` and `/dev/sdbY` accordingly):

```
$ mkdir mnt  
$ mkdir mnt/fat32
```

```
$ mkdir mnt/ext4
$ sudo umount /dev/sdbX
$ sudo umount /dev/sdbY
$ sudo mount /dev/sdbX mnt/fat32
$ sudo mount /dev/sdbY mnt/ext4
$ sudo env PATH=$PATH make ARCH=arm CROSS_COMPILE=arm-linux-gnueabi-hf-
INSTALL_MOD_PATH=mnt/ext4 modules_install
$ sudo cp mnt/fat32/$KERNEL.img mnt/fat32/$KERNEL-backup.img
$ sudo cp arch/arm/boot/zImage mnt/fat32/$KERNEL.img
$ sudo cp arch/arm/boot/dts/*.dtb mnt/fat32/
$ sudo cp arch/arm/boot/dts/overlays/*.dtb* mnt/fat32/overlays/
$ sudo cp arch/arm/boot/dts/overlays/README mnt/fat32/overlays/
$ sudo umount mnt/fat32
$ sudo umount mnt/ext4
```

### 1.3 Kernel Modification

Configure Linux source to opt-in Integrity Measurement Architecture (IMA) security module:

```
$ make ARCH=arm CROSS_COMPILE=arm-linux-gnueabihf- menuconfig
```

Enable IMA module:

```
Security options --->
[*] Enable different security models
[*] Integrity subsystem
[*] Integrity Measurement Architecture(IMA)
    Default template (ima-sig) --->
    Default integrity hash algorithm (SHA256) --->
[*] Enable multiple writes to the IMA policy
[*] Enable reading back the current IMA policy
```

Make following changes to enable early initialization of SPI and TPM before IMA activation.

Set TPM as **built-in** module:

```
Device Drivers --->
Character devices --->
-*- TPM Hardware Support --->
<*> TPM Interface Specification 1.3 Interface / TPM 2.0 FIFO Interface - (SPI)
```

Set SPI as **built-in** module:

```
Device Drivers --->
[*] SPI support --->
    <*> BCM2835 SPI controller
```

To enable early loading of SPI subsystem, remove the following line from *drivers/clk/bcm/clk-bcm2835.c*:

```
postcore_initcall(__bcm2835_clk_driver_init);
```

Replace it with:

```
subsys_initcall(__bcm2835_clk_driver_init);
```

Modify line 122 of file *security/integrity/ima/ima\_policy.c*. The modification simplifies the policy for ease of understanding. The new policy restricts IMA measurement to only root owned executable file. Now re-build kernel image following section 1.2.

```
static struct ima_rule_entry default_measurement_rules[] __ro_after_init = {
    { .action = MEASURE, .func = FILE_CHECK, .mask = MAY_EXEC,
      .uid = GLOBAL_ROOT_UID, .uid_op = &uid_eq,
      .flags = IMA_FUNC | IMA_INMASK | IMA_UID },
};
```

## 2 Software Setup

This section describes how to install and enable all necessary software on a Raspberry Pi®.

<b>2.1</b>	Enable TPM and IMA.
<b>2.2</b>	Install TPM software stack.
<b>2.3</b>	Download and build server source.
<b>2.4</b>	Download and build device source.

Table 1: Software setup

## 2.1 Enable TPM & IMA

Insert the flashed SD card and boot the Raspberry Pi®.

### **Config.txt**

Open the file config.txt in an editor:

```
$ sudo nano /boot/config.txt
```

Insert the following lines to enable SPI and TPM:

```
dtparam=spi=on  
dtoverlay=tpm-slbi9670
```

Save the file and exit the editor.

### **Cmdline.txt**

Open the file cmdline.txt in an editor:

```
$ sudo nano /boot/cmdline.txt
```

Append the following to the existing line:

```
ima_policy=tcb
```

Save the file then exit the editor.

Reboot the Raspberry Pi® for both changes to take effect:

```
$ reboot
```

Check if TPM is activated by:

```
$ ls /dev | grep tpm  
tpm0  
tpmrm0
```

Check if IMA is activated. The return value must be greater than 1.

```
$ sudo cat /sys/kernel/security/ima/runtime_measurements_count  
146
```

Check if IMA policy is configured correctly.

```
$ sudo cat /sys/kernel/security/ima/policy  
dont_measure fsmagic=0x9fa0  
dont_measure fsmagic=0x62656572  
dont_measure fsmagic=0x64626720  
dont_measure fsmagic=0x1021994  
dont_measure fsmagic=0x1cd1
```

```
dont_measure fsmagic=0x42494e4d
dont_measure fsmagic=0x73636673
dont_measure fsmagic=0xf97cff8c
dont_measure fsmagic=0x43415d53
dont_measure fsmagic=0x27e0eb
dont_measure fsmagic=0x63677270
dont_measure fsmagic=0x6e736673
measure func=FILE_CHECK mask=^MAY_EXEC uid=0
```

Lastly, check if IMA template (ima-sig) and algorithm (SHA256) is set correctly by inspecting the file `ascii_runtime_measurements`.

```
$ sudo cat /sys/kernel/security/ima/ascii_runtime_measurements
10 <20 bytes of hash value> ima-sig sha1:<20 bytes of hash value> boot_aggregate
10 <20 bytes of hash value> ima-sig sha256:<32 bytes of hash value> <filename with
path>
...
```

## 2.2 Install TPM Software

Boot the Raspberry Pi® and install the following software:

Software	Link	Version
tpm2-tss	<a href="https://github.com/tpm2-software/tpm2-tss">https://github.com/tpm2-software/tpm2-tss</a>	2.4.0
tpm2-tools	<a href="https://github.com/tpm2-software/tpm2-tools">https://github.com/tpm2-software/tpm2-tools</a>	4.2

Table 2: TPM 2.0 software

Install dependencies:

```
$ sudo apt update
$ sudo apt -y install autoconf-archive libcmocka0 libcmocka-dev procps iproute2
build-essential git pkg-config gcc libtool automake libssl-dev uthash-dev autoconf
doxygen libgcrypt-dev libjson-c-dev libcurl4-gnutls-dev uuid-dev pandoc
```

Download, build, and install TPM software stack:

```
$ git clone https://github.com/tpm2-software/tpm2-tss.git
$ cd tpm2-tss
$ git checkout 2.4.0
$ ./bootstrap
$ ./configure
$ make -j$(nproc)
$ sudo make install
$ sudo ldconfig
```

Download, build, and install TPM tools:

```
$ git clone https://github.com/tpm2-software/tpm2-tools.git
$ cd tpm2-tools
$ git checkout 4.2
$ ./bootstrap
$ ./configure
$ make -j$(nproc)
$ sudo make install
$ sudo ldconfig
```

## 2.3 Install Server Software

Information on software licenses used at frontend & backend of server:

Software	Link	License
Spring Framework	<a href="https://spring.io/">https://spring.io/</a>	Apache License 2.0
Material Design for Bootstrap (Free version)	<a href="https://github.com/mdbootstrap/bootstrap-material-design">https://github.com/mdbootstrap/bootstrap-material-design</a>	MIT License
TPM Software Stack from Microsoft Research	<a href="https://github.com/microsoft/TSS.MSR">https://github.com/microsoft/TSS.MSR</a>	MIT License
OpenJDK	<a href="https://openjdk.java.net/">https://openjdk.java.net/</a>	OpenJDK Community TCK License Agreement
SockJS-client	<a href="https://github.com/sockjs/sockjs-client">https://github.com/sockjs/sockjs-client</a>	MIT License
STOMP.js	<a href="https://github.com/stomp-js/stompjs">https://github.com/stomp-js/stompjs</a>	MIT License

Table 3: Server software licensing information

Install dependencies:

```
$ sudo apt install maven openjdk-9-jre
```

Download and build server source:

```
$ git clone https://github.com/infineon/remote-attestation-optiga-tpm -b server
$ cd remote-attestation-optiga-tpm
$ mvn install
```

## 2.4 Install Device Software

The device software is composed of application to communicate with server, and step-by-step scripts to perform remote attestation.

Install dependencies:

```
$ sudo apt update
$ sudo apt install libconfig-dev libjson-c-dev libcurl4-gnutls-dev
```

Download and build device software:

```
$ git clone https://github.com/infineon/remote-attestation-optiga-tpm -b device
$ cd remote-attestation-optiga-tpm
$ make
```

## 3 Operation Guide

This section describes all necessary steps to perform remote attestation in the following sequence.

<b>3.1</b>	Run Server.
<b>3.2</b>	Provision TPM.
<b>3.3</b>	Run Device Scripts.

Table 4: Operation guide

### 3.1 Run Server

For better user experience and quicker response time, it is possible to host the server on a separate machine or remote server. The guide for server hosting is not covered in this document.

Run server on Raspberry Pi®:

```
$ cd remote-attestation-optiga-tpm/server/target
$ sudo java -jar server-0.0.1-SNAPSHOT.jar
```

The server is ready for operation once you see the following message:

```
...
2020-06-10 22:37:51.856 INFO 12828 --- [          main]
o.s.m.s.b.SimpleBrokerMessageHandler : Started.
2020-06-10 22:37:52.414 INFO 12828 --- [          main]
o.s.b.w.embedded.tomcat.TomcatWebServer : Tomcat started on port(s): 443 (https)
80 (http) with context path ''
2020-06-10 22:37:52.418 INFO 12828 --- [          main]
com.ifx.server.ServerApplication : Started ServerApplication in 91.269
seconds (JVM running for 98.966)
```

View the webpage (<https://localhost>) using Raspberry Pi® OS built-in web browser. A warning message may appear, it is expected since server is using a self-signed certificate. Bypass the warning and proceed as usual. Slower loading time is expected on Raspberry Pi® 3.

On the upper menu bar, click on “Start” to enter the sign in page (*Figure 2: Sign in*). Sign in using the following credential to enter a self-explanatory dashboard page.

<b>Username</b>	infineon
<b>Password</b>	password

Table 5: User account

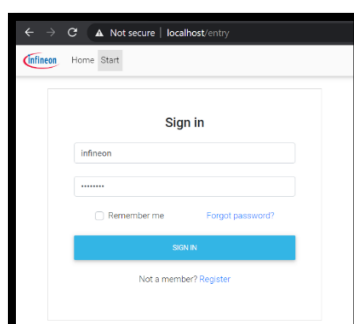

Figure 2: Sign in

## 3.2 Provision TPM

Following steps are executed on Raspberry Pi®.

Perform a TPM clear on the platform hierarchy:

```
$ sudo chmod a+rw /dev/tpm0
$ sudo chmod a+rw /dev/tpmrm0
$ tpm2_clear -c p
```

Generate TCG profile compliant endorsement key (EK) and store it as persistent key:

```
$ tpm2_createek -G rsa -u ek.pub -c ek.ctx
$ tpm2_evictcontrol -C o -c ek.ctx 0x81010001
```

Generate attestation key (AK) and store it as persistent key:

```
$ tpm2_createak -C 0x81010001 -c ak.ctx -G rsa -g sha256 -s rsassa -u ak.pub -n
ak.name
$ tpm2_evictcontrol -C o -c ak.ctx 0x81000002
```

Verify generated keys by reading TPM persistent handles:

```
$ tpm2_getcap handles-persistent
- 0x81000002
- 0x81010001
```

### 3.3 Run Device Scripts

Navigate to directory:

```
$ cd remote-attestation-optiga-tpm/
```

The *config.cfg* is a configuration file. View the file for more information.

Navigate to directory:

```
$ cd remote-attestation-optiga-tpm/bin
```

Execute following scripts sequentially.

<b>0_prep.sh</b>	Authorize non-privileged access to the TPM device node.
<b>1_cleanup.sh</b>	Erase non-essential files and restore <i>config.cfg</i> .
<b>2_pcr.sh</b>	Read TPM PCRs and the IMA log.
<b>3_attune.sh</b>	Register a good platform measurement to a server.
<b>4_atelic.sh</b>	Ask for a server encrypted challenge.
<b>5_credential.sh</b>	Decrypt the challenge using <i>tpm2_activatecredential</i> feature.
<b>6_quote.sh</b>	Generate a quote and a signature using <i>tpm2_quote</i> feature. Skip step <b>6_quote-bad.sh</b> if this script is executed.
<b>6_quote-bad.sh</b>	This is to trigger a failure using an invalid challenge. Skip <b>6_quote.sh</b> if this script is executed.
<b>7_attest.sh</b>	Send the quote, signature, and the latest IMA log to a server to perform attestation.

Table 6: Device scripts

## 4 Architecture

This section describes the architecture of the system.

Figure 3: Operation flow

## 4.1 Attune

Attune is a process to register the following parameters to a server. These parameters are considered as a good reference and it will be used for verification purpose at the attestation stage.

<b>sha1pcrs</b>	PCR bank (SHA1) register indexes, e.g. [9,10].
<b>sha2pcrs</b>	PCR bank (SHA256) register indexes, e.g. [9,10].
<b>ekCrt</b>	EK certificate issued by TPM manufacturer: <pre>\$ tpm2_nvread 0x1c00002 -s 1184 --offset 0 -o ek.crt</pre> Inspect the certificate: <pre>\$ openssl x509 -inform der -in ek.crt -text -noout</pre>
<b>akPub</b>	AK public key: <pre>\$ tpm2_readpublic -c 0x8100002 -o ak.pub</pre>
<b>pcrs</b>	TPM PCR values: <pre>\$ tpm2_pcrread -o pcr</pre> PCRs that are not indicated by sha1pcrs/sha2pcrs are filtered.
<b>imaTemplate</b>	A log that records IMA measured files: <pre>/sys/kernel/security/ima/binary_runtime_measurements</pre> A human readable version at: <pre>/sys/kernel/security/ima/ascii_runtime_measurements</pre>

Table 7: Attune parameters

Figure 4: `ascii_runtime_measurements` is a sample log file generated by the IMA subsystem at runtime. It contains a list of measured files. Hash value of each file is extended to the TPM PCR-10 (IMA uses PCR index 10 by default) sequentially. Since Linux is not deterministic in the sequence it starts programs, the log changes after each power cycle, and this will result in a different PCR-10 value. Therefore, for server to correctly verify a PCR-10 value, the reference value must be computed from the *attune.imaTemplate* log based on the boot sequence.

```
pi@raspberrypi:~$ sudo cat /sys/kernel/security/ima/ascii_runtime_measurements

## 4.2 Atelic

Atelic is a process to request for a challenge from a server. In response to atelic, the server generates a challenge then encrypts it using TPM credential feature (*tpm2\_makecredential*).

Parameters consumed by *tpm2\_makecredential*:

<b>EK public key</b>	EK public key.
<b>AK name</b>	A name derived from AK public key blob.
<b>Challenge</b>	A random string.

Table 8: Make credential parameters

The requester can decrypt the credential blob and recover the challenge by performing the following:

```
$ tpm2_startauthsession --policy-session -S session.ctx
$ tpm2_policysecret -S session.ctx -c 0x4000000B
$ tpm2_activatecredential -c 0x81000002 -C 0x81010001 -i credential.blob -o
qualification -P"session:session.ctx"
$ tpm2_flushcontext session.ctx
$ rm session.ctx
```

A challenge is also known as a qualification value. This value will be used in the next section.

### 4.3 Attest

Attest is a process to request a server to perform remote attestation. The following parameters are attached to the request:

<b>quote, sig</b>	Quote and its signature can be produced by: <pre>\$ tpm2_quote -c 0x81000002 -q qualification -l sha1:9,10+sha256:9,10 -m quote -s sig</pre>
<b>imaTemplate</b>	The latest IMA log, similar to <i>attune.imaTemplate</i> .

Table 9: Attest parameters

Attestation on a server is done by validating the content of a quote and its signature:

<b>Quote</b>	Detailed breakdown of a quote:
<b>PCR bank (SHA1) register indexes</b>	Same value as <i>attune.sha1pcrs</i> .
<b>PCR bank (SHA256) register indexes</b>	Same value as <i>attune.sha2pcrs</i> .
<b>PCRs digest</b>	Same value as computed digest, see below.
<b>Qualification</b>	Same value as server challenge.
<b>AK name</b>	Not implemented.
<b>Firmware version</b>	Not implemented.
<b>TPM clock</b>	Not implemented.
Computation of PCRs digest:	
<ol style="list-style-type: none"> <li>1. Set <i>attest.imaTemplate</i> as a sorting reference. Rearrange the order of <i>attune.imaTemplate</i> to match with the reference. Hash the reordered <i>attune.imaTemplate</i> to compute the value of PCR-10.</li> <li>2. Replace the PCR-10 value in <i>attune.pcrs</i> with the new value, hash the <i>attune.pcrs</i> to obtain the final digest.</li> <li>3. The quote's PCRs digest must be equal to the computed digest to pass the verification.</li> </ol>	
<b>Signature</b>	Verify quote's signature using AK public key.

Table 10: Attestation
